JS

What is
Array Destructuring
in JavaScript

**Simplest Explanation**

Swipe >

Array Destructuring simply means storing the values of an array into separate variables.

Here's the code example of How to Destructure an Array in JavaScript

In this example, we have an Array (arr). We want to **store the values of the array** into the **separate variables val1, val2, val3**. So we used **Array Destructuring** here. We created the three variables an then assigned them the values of the array respectively.

```javascript
const arr = [10, 20, 30];

const [val1, val2, val3] = arr;

console.log(val1); //output = 10
console.log(val2); //output = 20
console.log(val3); //output = 30
```
